4.1.2.2.1 Statistical Model: Results and Interpretations
The analyses demonstrate increasing trends in TDS concentrations for the water supply and recycled water. Based on the analysis, the recycled water trend envelop has an average increase of 1.36 mg/L per year. IEUA’s internal trigger limit (530 mg/L) was reached in 2015 and, based on the trends, the statistical model forecasts exceedance of the RWQCB TDS Action Limit (545 mg/L) and Maximum limit (550 mg/L) within the next 11 to 14 years, respectively (Figure 13).

Figure 13: Recycled Water Statistical Model Trend Envelop Results

4.1.2.2.2 Simulation (Repeat of History): Results and Interpretations
IEUA also performed a model simulation to identify when a potential exceedance could occur if historical TDS concentrations patterns were repeated. For this simulation, data for the past 15 years (2005 – 2019) was repeated as depicted in Figure 14. The historical pattern was simulated to begin starting in 2020. With this method, the recycled water TDS concentrations is projected to exceed the NPDES Maximum Limit in 2030, or in the next 10 years.
